Detailed Description of Occurrence:

On Saturday morning (4/2/22) at approximately 7 AM during routine site inspections, the site Team identified an area on the slope above the easement road of the bowl area (Phase VB/Phase IV-A Part 3), that looked to be a potential sub surface oxidation event (SSO).

Actions taken to mitigate this occurrence:

The area identified was a small surface hole in the soil (approximately one square foot). After discovering this area, the Team followed response protocol to shutoff nearby wells (IDs CGW2126, CGW3536, CGW6064, CGW3613, CGW3614), added additional cover to the area, and moisture condition and track walked the area. After the initial response, we evaluated the gas infrastructure for any damage, and found none. Probes are being installed around the area of the SSO. The team is actively investigating the cause and will continue to gather data until the SSO event is completely snuffed, and update the group accordingly. Additional data will be provided as we have it.

Good Morning,

The team is actively investigating the cause and will continue to gather data until the SSO event is completely snuffed, and update the group accordingly.

Additional data will be provided as we have it. In the meantime, please let me know if you have any questions.
